# DFA minimization

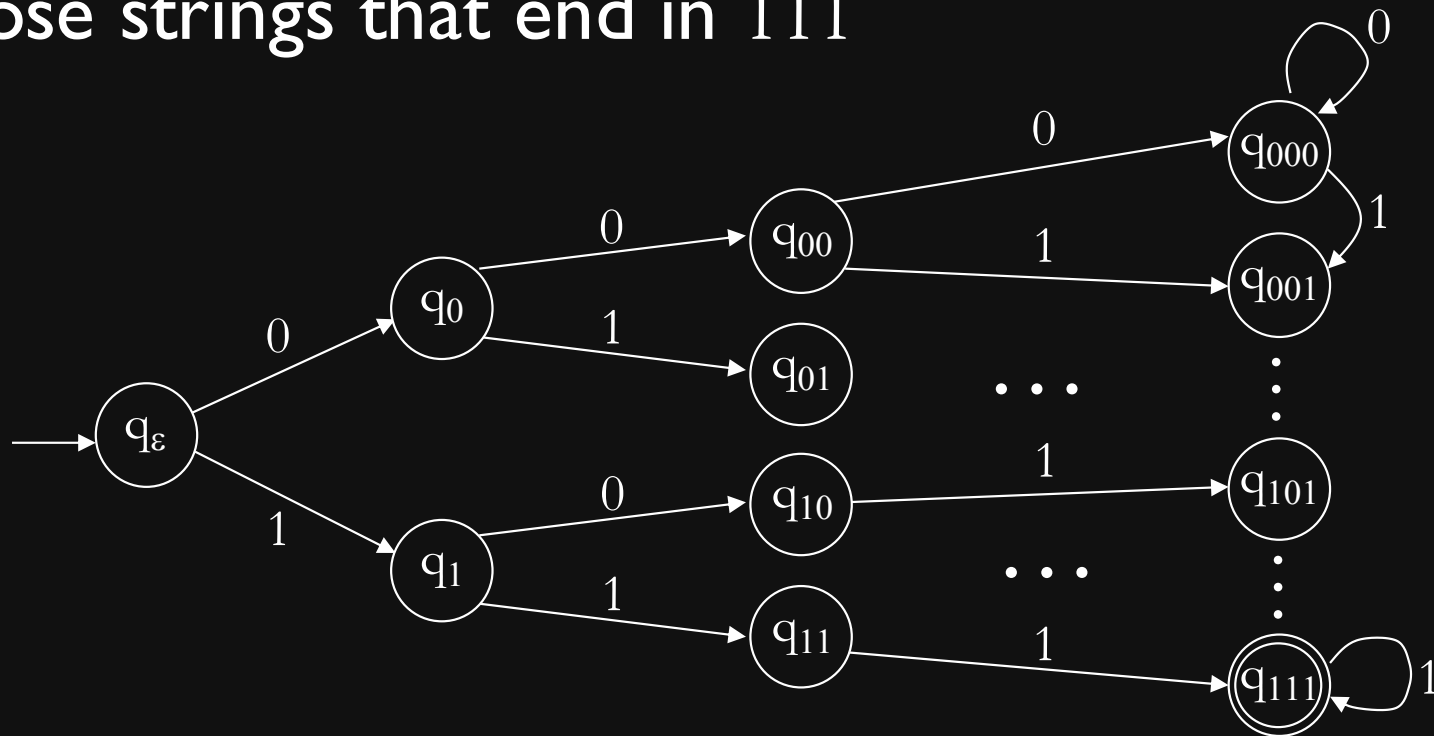

Andrej Bogdanov

<http://www.cse.cuhk.edu.hk/~andrejb/csc3130>

---

# Example

- Construct a DFA over alphabet  $\{0, 1\}$  that accepts those strings that end in 111

- This is big, isn't there a **smaller** DFA for this?

# Smaller DFA

---

Can we do it with 3 states?

# Even smaller DFA?

---

- Suppose we had a 3 state DFA  $M$  for  $L$

... let's imagine what happens when:

inputs:

$\varepsilon, 1, 11, 111$

- By the **pigeonhole principle**, on two of these inputs  $M$  ends in the same state

# Pigeonhole principle

---

Suppose you are tossing  $m$  balls into  $n$  bins, and  $m > n$ . Then two balls end up in the same bin.

- Here, balls are **inputs**, bins are **states**:

If you have a DFA with  $n$  states and you run it on  $m$  inputs, and  $m > n$ , then two inputs end up in same state.

# A smaller DFA

- Suppose  $M$  ends up in the same state after reading inputs  $x = 1$  and  $y = 11$

- Then after reading **one more 1**
  - The state of  $x1 = 11$  should be **rejecting**
  - The state of  $y1 = 111$  should be **accepting**
- ... but they are both the same state!

# A smaller DFA

- Suppose  $M$  ends up in the same state after reading inputs  $x = \varepsilon$  and  $y = 1$

- Then after reading **11**
  - The state of  $x1 = 11$  should be **rejecting**
  - The state of  $y1 = 111$  should be **accepting**
- ... but they are both the same state!

# No smaller DFA!

---

- After looking at all possible pairs for  $x, y, x \neq y$

$(\epsilon, 1)$     $(\epsilon, 11)$     $(\epsilon, 111)$     $(1, 11)$     $(1, 111)$     $(11, 111)$

we conclude that

There is no DFA with 3 states for  $L$

- So, this DFA is **minimal**

# DFA minimization

We will show how to turn **any DFA** for  $L$  into the **minimal DFA** for  $L$

# Minimal DFAs and distinguishable states

- First, we have to **understand** minimal DFAs:

minimal DFA

every pair of states  
is distinguishable

# Distinguishable states

- Two states  $q$  and  $q'$  are distinguishable if

on the same continuation string  $w_1 w_2 \dots w_k$ , one accepts, but the other rejects

# Examples of distinguishable states

$(q_0, q_1)$  distinguishable by 01

$(q_0, q_2)$  distinguishable by 1

$(q_0, q_3)$  distinguishable by  $\varepsilon$

$(q_1, q_2)$  distinguishable by 1

$(q_1, q_3)$  distinguishable by  $\varepsilon$

$(q_2, q_3)$  distinguishable by  $\varepsilon$

**DFA is minimal**

# Examples of distinguishable states

$(q_0, q_3)$  distinguishable by  $\varepsilon$

$(q_1, q_3)$  distinguishable by  $\varepsilon$

$(q_2, q_3)$  distinguishable by  $\varepsilon$

$(q_1, q_2)$  distinguishable by 0

$(q_0, q_2)$  distinguishable by 0

$(q_0, q_1)$  indistinguishable

indistinguishable pairs  
can be merged

# Examples of distinguishable states

$(q_0, q_2)$  distinguishable by  $\varepsilon$

$(q_1, q_2)$  distinguishable by  $\varepsilon$

$(q_0, q_3)$  distinguishable by  $\varepsilon$

$(q_1, q_3)$  distinguishable by  $\varepsilon$

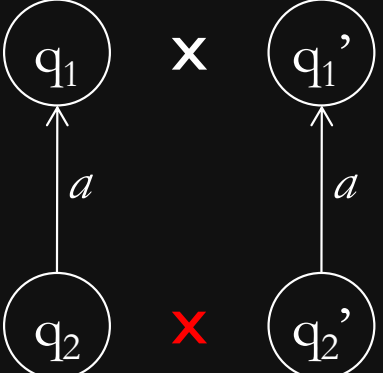

$(q_0, q_1)$  indistinguishable

$(q_2, q_3)$  indistinguishable

# Finding (in)distinguishable states

---

**Rule 1:**  If  $q$  is accepting and  $q'$  is rejecting  
**Mark**  $(q, q')$  as distinguishable (x)

**Rule 2:**  If  $(q_1, q_1')$  are marked,  
**Mark**  $(q_2, q_2')$  as distinguishable (x)

**Rule 3:** Unmarked pairs are indistinguishable  
Merge them together

# Example of DFA minimization

$q_0$						
$q_1$						
$q_{00}$						
$q_{01}$						
$q_{10}$						
$q_{11}$						
	$q_\epsilon$	$q_0$	$q_1$	$q_{00}$	$q_{01}$	$q_{10}$

# Example of DFA minimization

$q_0$						
$q_1$						
$q_{00}$						
$q_{01}$						
$q_{10}$						
$q_{11}$	X	X	X	X	X	X
	$q_\epsilon$	$q_0$	$q_1$	$q_{00}$	$q_{01}$	$q_{10}$

①  $q_{11}$  is distinguishable from all other states

# Example of DFA minimization

$q_0$						
$q_1$	X	X				
$q_{00}$			X			
$q_{01}$						
$q_{10}$			X			
$q_{11}$	X	X	X	X	X	X
	$q_\epsilon$	$q_0$	$q_1$	$q_{00}$	$q_{01}$	$q_{10}$

- ②  $q_1$  is distinguishable from  $q_\epsilon, q_0, q_{00}, q_{10}$   
On transition 1, they go to distinguishable states

# Example of DFA minimization

$q_0$						
$q_1$	X	X				
$q_{00}$			X			
$q_{01}$	X	X		X		
$q_{10}$			X		X	
$q_{11}$	X	X	X	X	X	X
	$q_\epsilon$	$q_0$	$q_1$	$q_{00}$	$q_{01}$	$q_{10}$

- ②  $q_{01}$  is distinguishable from  $q_\epsilon$ ,  $q_0$ ,  $q_{00}$ ,  $q_{10}$   
On transition 1, they go to distinguishable states

# Example of DFA minimization

$q_0$	A					
$q_1$	x	x				
$q_{00}$	A	A	x			
$q_{01}$	x	x	B	x		
$q_{10}$	A	A	x	A	x	
$q_{11}$	x	x	x	x	x	x
	$q_\epsilon$	$q_0$	$q_1$	$q_{00}$	$q_{01}$	$q_{10}$

## ③ Merge states not marked distinguishable

$q_\epsilon$ ,  $q_0$ ,  $q_{00}$ ,  $q_{10}$  are equivalent  $\rightarrow$  group A

$q_1$ ,  $q_{01}$  are equivalent  $\rightarrow$  group B

$q_{11}$  cannot be merged  $\rightarrow$  group C

# Example of DFA minimization

$q_0$	A					
$q_1$	x	x				
$q_{00}$	A	A	x			
$q_{01}$	x	x	B	x		
$q_{10}$	A	A	x	A	x	
$q_{11}$	x	x	x	x	x	x
	$q_\epsilon$	$q_0$	$q_1$	$q_{00}$	$q_{01}$	$q_{10}$

minimized DFA:

# Food for thought

---

- Why does method find **all** distinguishable pairs?

Because we **work backwards**

# Food for thought

- Why are there no inconsistencies when we merge?

Because we only merge indistinguishable states

# Food for thought

---

- Why is there no smaller DFA?

Suppose there is

By the **pigeonhole principle** this must happen:

# Food for thought

- Why is there no smaller DFA?

But then

Every pair of states  
is distinguishable

$q''$  cannot exist!
